PROFESSIONAL SUMMARY

Full-Stack Product Engineer with 4+ years shipping production web and mobile applications. Frontend is my specialty (React, Next.js, TypeScript), and I build the rest of the stack whenever the product needs it: NestJS APIs, PostgreSQL, queues, payments, mobile and deployment. I work with Claude Code every day in a spec-first workflow (feature specs, Architecture Decision Records and runbooks in every repository) and test every path until I can defend the code and fix it fast. When a project needs technology I have not used, I write my own lessons and verify everything: my payment orchestrator started with almost no NestJS or ledger knowledge and closed four weeks later with 300+ tests and every payment rail verified on real test networks. Looking for a product startup building something new.

TECHNICAL SKILLS

- **Frontend:** React, Next.js, TypeScript, JavaScript, Angular, Tailwind CSS, TanStack Query, Zustand, Storybook, design systems, CSS/SASS, responsive design, Progressive Web Apps (PWA)
- **Backend & Data:** NestJS, Node.js, Express, Prisma, PostgreSQL (pgvector), Redis, BullMQ, SQLite, SQL Server, MySQL, Firebase, REST APIs, Zod contracts, webhooks, hexagonal architecture, Python (FastAPI), .NET, C#, Java
- **Mobile:** React Native, Expo (Expo Router, EAS Update), offline-first SQLite with Drizzle, Capacitor, Android (TWA)
- **AI & Automation:** LLM API integration (Anthropic Claude, Google Gemini, DeepSeek), RAG, pgvector, embeddings, Model Context Protocol (MCP), structured outputs, AI-assisted development with Claude Code
- **Payments & Web3:** Stripe, Mercado Pago, double-entry ledgers, idempotency, reconciliation, viem (EVM), TronWeb, USDT and USDC on testnets; Niubiz, OpenPay and Yape integrations
- **Testing & Quality:** Vitest, Jest, Testing Library, Testcontainers, pytest, CI quality gates, secret scanning (gitleaks), Architecture Decision Records (ADRs)
- **Cloud & DevOps:** Docker, Docker Compose, Nginx, GitHub Actions, Cloudflare (Pages, Tunnel), Oracle Cloud, AWS (S3, Amplify), Linux, Turborepo and pnpm monorepos
- **Domains:** AI consumer products, dating and matchmaking, health and nutrition, payments and fintech, crypto, edtech

WORK EXPERIENCE

Frontend Engineer — PAIRUS INC. (Remote, Canada)

July 2025 - January 2026

- Led frontend development in Next.js, React and TypeScript for an AI dating and matchmaking product that turns a personality questionnaire into an embedding, a written profile and a ranked list of the most compatible matches.
- Built the questionnaire and results interfaces end to end and integrated the AI services that produce the embeddings and compatibility scoring.
- Designed and implemented real-time monitoring dashboards and log-visualization interfaces, giving the team direct visibility into system behavior.
- Built and optimized Stripe payment interfaces, focused on secure transaction handling and checkout conversion.

Software Engineer (Contract) — BELSITEC

June 2023 - Present

- Led full-stack development of admission and student portals for Continental University across three markets (Peru, Florida and Mexico), with Angular frontends.
- Built the complete web platform for a private school (administrative and student portals, automated email, deployment) and its mobile app, which records attendance by scanning student QR codes and feeds attendance and grade reports.
- Maintain Contipay, the in-house payment gateway built on Node.js and Express that connects Niubiz, Mercado Pago, OpenPay and Yape: when something fails, I find the cause and ship the fix.
- Implemented microservices in .NET, C# and Java, stored procedures and reporting services with Argos and SQL, and manage containerized deployment with Docker behind Nginx.

Frontend & Full-Stack Developer — Independent

2023 - Present

- Architected and shipped a restaurant reservation Progressive Web App (PWA) for iOS and Android, with an administrative portal for content and user management.

- Built a fully self-manageable website for a construction-supplies business: Next.js frontend deployed on Cloudflare, Firebase backend with file upload, and an admin panel letting the owner edit any text or image on the site without developer involvement.

Technology Consultant (Intern) — IBM Peru

April 2022 - March 2023

- Consulted on web and mobile application development for corporate clients, administered IBM Cloud services, and provided technical support, maintenance and error control for mission-critical corporate applications.

PROJECTS

Self-directed products, each with specs, architecture decisions and automated tests in its repository.

Live and code: tickerlens.oscarnavarro.dev · study.oscarnavarro.dev · github.com/oscardanielnc/payment-orchestrator

Payment Orchestrator — payments platform · NestJS, Prisma, PostgreSQL, BullMQ, React, Storybook, Stripe, Mercado Pago, viem, TronWeb

- One API and a hosted checkout that route each charge to Stripe (cards), Mercado Pago, USDT on TRON or USDC on Base, confirmed by webhook or on-chain and recorded in an append-only double-entry ledger; a daily job reconciles every provider against it.
- Hexagonal NestJS modules with abstract-class ports, a transactional outbox with BullMQ workers, idempotency keys in PostgreSQL, HMAC-signed merchant webhooks with retries, and an environment guard that refuses to start with live keys or mainnet networks.
- Learned NestJS, accounting ledgers and on-chain payments from scratch with my own lessons; documented 23 architecture decisions, verified every rail on real test networks, and covered it with 300+ tests (Vitest, Testcontainers) and CI with secret scanning.

Kawsay — offline-first nutrition and wellbeing app · Expo, React Native, SQLite/Drizzle, NestJS, Prisma

- Android app for food, activity, body and mood whose daily nutrition targets follow the day actually lived; in daily personal use since October 2026.
- Monorepo shared by phone and server: pure TypeScript domain rules on both sides, SQLite with Drizzle on the device, push/pull sync to a NestJS and Prisma API on Oracle Cloud (Docker Compose), and over-the-air updates with EAS.
- AI behind a port (DeepSeek): the model picks foods while food-composition tables compute the nutrients, and private entries are locked on the device and never reach the AI. 600+ automated tests across app, API and shared core.

TickerLens — AI equity research platform · Next.js, TypeScript, FastAPI, PostgreSQL/pgvector

- Full-stack RAG application: enter a ticker and get a cited bull/bear analysis, every claim linked to its source and streamed to the React frontend over Server-Sent Events; retrieval runs over data the app computes itself. Docker behind Nginx, per-IP rate limiting, GitHub Actions CI.

Estudia — AI study companion · Python, FastAPI, SQLite, PWA and Android

- Photograph handwritten notes and get a summary and an auto-graded exam through a three-stage LLM pipeline (vision transcription, summary, questions); closed all ten findings of a security audit, including stored XSS from AI output and cross-tenant access, with regression tests. 168 tests.

Additional projects

- **Trading research systems (Kepler, tvindicators, Oscilion, momentum-investor)** - Python, FastAPI, ccxt, Alpaca. Built to test strategies against live markets and closed when the evidence showed no edge; Kepler ran on live capital for 18 days with drawdown held to 3.4% against a 10% budget.
- **oscarnavarro.dev** - Next.js static export with an interactive three.js avatar and project demos recorded automatically with Playwright, in English and Spanish.
- **Also built** - an OSINT exposure dashboard with 13 parallel collectors (FastAPI, Next.js, Playwright; 234 tests), a local-first weight tracker (React, SQLite in WebAssembly, Capacitor; 30 tests) and a desktop video editor for multi-gigabyte recordings (PySide6, FFmpeg with NVENC; 96 tests).

EDUCATION & LANGUAGES

Pontificia Universidad Católica del Perú (PUCP) - Lima, Peru
Bachelor's Degree in Computer Engineering

- **Languages:** Spanish (native). English - intermediate (B1); comfortable reading and writing technical English, spoken English improving.
